

Jagram Revelatio Carport Assembly Advice

The Revelatio series of carports are superb quality, large and heavy carports. Featuring pressure treated glulam timber construction, the buildings are likely to be in the garden for very many years with just simple and basic maintenance.

It is essential that the base be constructed with care and it must be remembered that there is significant uplift potential from wind under the carport. This means that when constructing the base, as well as remembering the weight of the building, the base must be designed in such a way that it prevents the building from being lifted out of the ground by strong winds.

In most cases there will be a requirement for mechanical lifting assistance when setting the posts and also to lift the roof beams which are very large and heavy.

Assembly should only be undertaken by professionals or by VERY experienced and capable DIYers and with the assistance of lifting devices.

Once the building is in location and assembled it is quite simply the most beautiful and sturdy carport that anyone is likely to find anywhere. As the wood is pressure treated when delivered, ongoing maintenance is fairly minimal. As with all of our garden building deliveries, delivery should be considered to be kerb side.
